INTRODUCTION

Presenting our new catalogue **CT2, Thermostats**, containing a large extension of our products, this has been achieved with our customers and partners' collaboration. **FAE** considers quality as a top priority that is why we are immersed in a continuous improvement, promoting the use of the most advanced methods for the development and manufacture of our products, such as Computer Aided Design (CAD), automated controls and process to obtain reliable test etc. allowing us to overcome successfully our clients' Quality Audits, working together and developing products for their new vehicles. Our aim with this new catalogue is to help our clients identify **our products and original pieces to be replaced**. Given that car manufacturers are constantly modifying, we cannot guarantee the full accuracy of the provided information in this FAE catalogue, used only as a guide. Names and manufacture references are only used for locating our products.

WARRANTY:
FAE guarantees all products against any manufacturing defects. This warranty is limited to the replacement of faulty spares. **FAE** does not hold itself responsible for the improper use of the product.

NOTES:
REFUND POLICY-**FAE** controls at 100% the production of all its products, checking and saving all manufacturing information. **FAE** does not refund any spare which has been taken out of its sealed plastic wrapper.
- **FAE** will not accept any refund for stock regulation reasons after a period of 6 months from the delivery date.
- **FAE** will refer to the Court of Barcelona in case of litigation.
- **FAE** reserves the right to modify the characteristics of its products without any prior warning.

FAE products have the technology to replace and adapt the original equivalent and must be assembled by skilled specialist, having vehicle assembling knowledge and following **FAE** or the original manufacturer's instructions. Any assembled piece not placed by a skilled specialist that represents a problem in its functioning and/or the vehicle, will not be **FAE**'s responsibility.

INTRODUCCIÓN

Presentamos este nuevo Catálogo **CT2, Termostatos,** que contiene una gran ampliación de la gama de nuestros productos y ha sido posible realizarla con la cooperación de nuestros clientes y colaboradores. **FAE** considera la calidad como un objetivo prioritario y por ello estamos inmersos en una mejora continua, promoviendo la aplicación de los medios más actualizados para el proyecto y fabricación de nuestros productos, como son el diseño asistido por ordenador, la automatización de controles y procesos para obtener ensayos de fiabilidad, etc., que nos permiten superar con éxito las Auditorías de Calidad de nuestros clientes, llegando a desarrollar conjuntamente productos para sus nuevos vehículos. Con este Catálogo, pretendemos ayudar a nuestros clientes en la rápida identificación de los productos de nuestra fabricación, **que reemplazan adaptándose a los equivalentes de origen.** Debido a las constantes variaciones de los fabricantes de vehículos, no podemos garantizar la completa exactitud de la información que se indica en este Catálogo de **FAE**, sirviendo únicamente como guía. Los nombres y referencias de los fabricantes sirven únicamente para ayudar a encontrar más rápidamente nuestros productos.

GARANTÍA:
FAE garantiza todos los productos contra fallos de fabricación. La garantía se limita al cambio del producto defectuoso, no cubriendo la mala aplicación o manipulación del mismo.

NOTAS:
DEVOLUCIÓN- **FAE** controla al 100% la producción de todos sus productos, comprueba y guarda la información del comportamiento de cada uno de ellos en el momento de su fabricación. Si cualquier producto ha sido extraído de su envoltorio de plástico, que va termo-sellado, no se podrá aceptar su devolución.
- **FAE** no aceptará devoluciones por regularización de stocks, transcurridos seis meses de la fecha de suministro.
- **FAE** ante cualquier tipo de litigio se remite a los Tribunales de Barcelona.
- **FAE** se reserva el derecho a modificar las características de sus productos sin previo aviso.

Los productos **FAE** tienen la tecnología para reemplazar y adaptarse a los equivalentes de origen y deben ser montados por personal especializado y con conocimientos en el montaje de componentes del vehículo, siguiendo las instrucciones de montaje de la pieza **FAE** y/o del origen. Cualquier montaje realizado por personal no especializado que represente un problema en el funcionamiento de la pieza y/o del vehículo no será responsabilidad de **FAE**.

INTRODUCTION

Nous présentons ce nouveau Catalogue **CT2, Thermostats**, qui contient une plus large gamme des séries de nos produits. Celui-ci a été réalisé grâce à la coopération de nos clients et partenaires. **FAE** conçoit la qualité comme un objectif prioritaire, pour cela, nous nous engageons à améliorer constamment notre manière de faire, en utilisant au possible les moyens les plus modernes dans le développement et la fabrication de nos produits, tels que la conception assistée par ordinateur, l'automatisation des contrôles et des tests de fiabilité, etc. Cela nous permet de passer avec succès les Contrôles qualité de nos clients et de développer avec eux de nouveaux produits pour leurs tous derniers véhicules. Nous avons faits en sorte que ce catalogue aide nos clients à identifier rapidement les produits de notre fabrication **qui équivalent et peuvent remplacer les pièces originales**. Etant données les fréquentes modifications des fabricants de véhicules, nous ne pouvons garantir la complète exactitude des informations apportées par ce catalogue **FAE** qui doit seulement être considéré comme un guide. Ainsi les noms et références des fabricants sont mentionnés dans l'unique but de faciliter la recherche de nos produits.

GARANTIE:
FAE garantie ses produits contre tout défaut de fabrication. La garantie est limitée au remplacement de la pièce défectueuse et ne couvre pas sa mauvaise installation ou encore la fausse manipulation de celle-ci.

REMARQUE:
REMBOURSEMENT- **FAE** contrôle à 100% la production de tous ses produits. Nous vérifions et gardons toutes les informations concernant leur comportement lors de la fabrication. Dès lors que n'importe quel produit a été extrait de son emballage plastique étanche, nous ne procédons à aucun remboursement.
- **FAE** refusera toute demande de remboursement pour motif de régularisation de stock, passé six mois de la date de livraison.
- **FAE** s'en remettra aux Tribunaux de Barcelone en cas de litige.
- **FAE** se réserve le droit de modifier les caractéristiques de ses produits sans aucun avis préalable.

Les produits **FAE** ont la technologie pour remplacer et s'adapter à leurs équivalents d'origine. Ils doivent être assemblés par un personnel qualifié et compétent dans l'ensemble des composants du véhicule, suivant les instructions de montage de la pièce **FAE** et/ou de l'origine. Tout assemblage par un personnel non qualifié qui représente un problème dans le fonctionnement de la pièce et/ou du véhicule ne sera pas de la responsabilité de **FAE**.

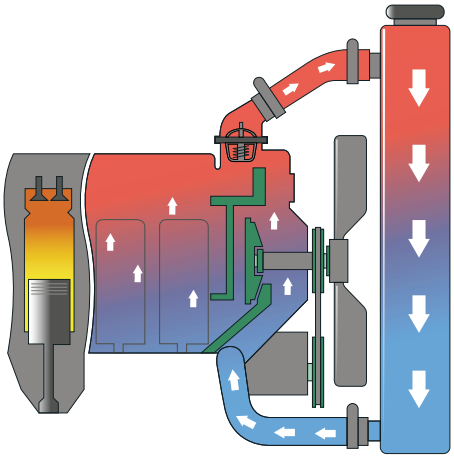
Todas las referencias FAE de Termostatos llevan una o varias juntas incluidas.

FAE fournit le kit complet des thermostats avec des joints d'étanchéité et/ou raccords, avec/sans boitier de sortie de l'eau, avec/sans joint d'étanchéité prisonnière, etc.
Voir l'image du produit sur la partie illustrée.
Tous les thermostats FAE sont fournis avec un ou plusieurs joints d'étanchéité.

TECHNICAL INFORMATION

THE REFRIGERATION OF INTERNAL COMBUSTION ENGINES

Less than a quarter of the calorific energy consumed in the internal combustion engine is transformed in useful force. The rest of the heat must be dissipated so that no engine part warms up to the point of preventing its correct functioning.



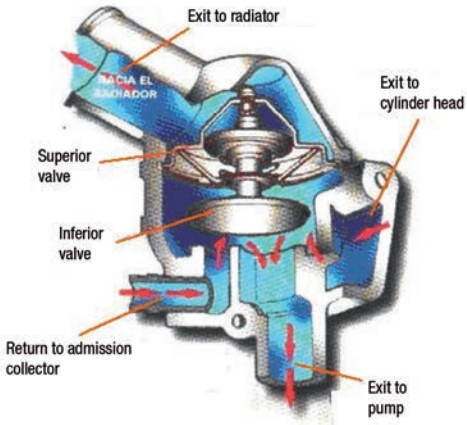
At full throttle, about 36 % of the heat is lost due to internal friction and heating of the lubricating oil. Another 33 % dissipates through the cooling system.

There are two types of cooling: direct and indirect. In the direct cooling system, the air circulates between the external cylinder wings and the cylinder head.

In the indirect system a coolant liquid, usually also antifreeze, circulates through leads inside the engine which is also cooled in the radiator.

The cooling circuit of internal combustion engines currently consists of:

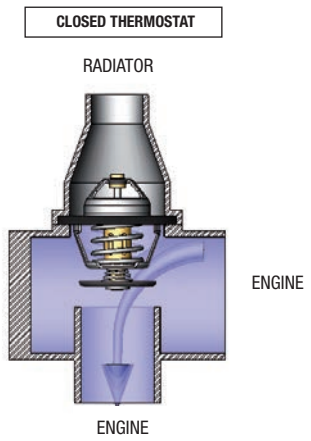
A covering that surrounds the warm parts of the engine; a radiator where the warm cooling liquid coming from the engine is cooled by air; a fan which forces air towards the radiator; a pump which forces cooling liquid circulation across the cooling system and a thermostat, placed at the engine vent, which regulates the flow of cooling liquid from the engine to the radiator.



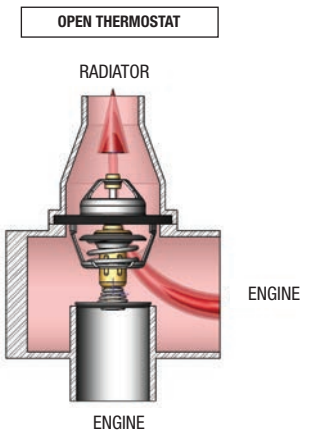
FUNCTION OF THE COOLING LIQUID IN THE COOLING AND WARMING OF THE ENGINE

The dimensions of the radiator and of the fan are calculated so that they allow the cooling of the engine in the most rigorous environmental conditions. For this reason, in winter months and at cold start, the cooling of the engine might be excessive, preventing from reaching the ideal operating temperature. Hence the need to intervene in the system of refrigeration in order to reduce as much as possible the time needed to reach the regime temperature of the engine. Moreover the possibility exists, in areas of extreme climate, of supporting the temperature of the refrigeration cooling liquid between 70°C and 90°C, which are ideal limits for the proper working of the engine.

To achieve this, it is enough to reduce properly the efficiency of the cooling circuit, reducing the circulation of the coolant or even suppressing it and making it circulate only inside the engine block.
The part which does this function is the THERMOSTAT, which is a valve usually inserted in the leads between the engine and the radiator.



In addition to its function as a valve which regulates cooling liquid flow, the thermostat is sometimes used to open or close electrical contacts when certain temperature limits are exceeded. These switches are normally to detect dangerous temperatures and to illuminate a red light in the dashboard, or to activate a fan. In this case the parts are called THERMOCONTACTS.



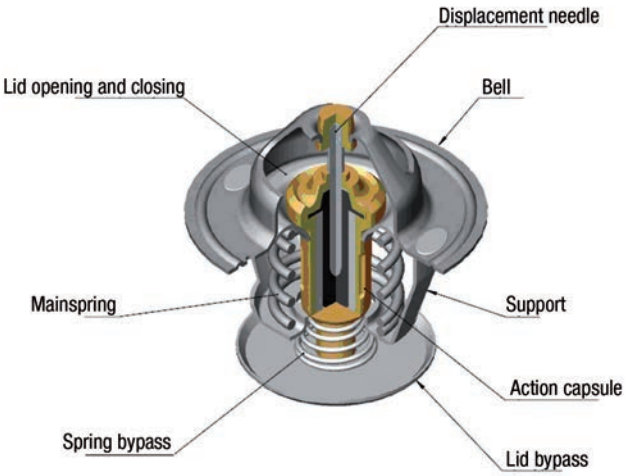
All thermostats inserted in the cooling liquid circuit must have a small passage for air bubbles, which remains open, even with a cold engine when the valve of the thermostat is closed, to avoid the formation of air bubbles in contact with the sensitive element of the thermostat, since it takes much more time to conduct heat through air compared to cooling liquid, and in case the engine is too warm, the thermostat would not open the passage towards the radiator in the precise moment.

Moreover, in order avoid detaining the circulation of cooling liquid to the pump, it is necessary that the chamber where the thermostat is placed communicates with the cooling liquid pump through a BY-PASS (second passage). When the engine is cold, this by-pass, is open and closes once the engine is warm and the thermostatic valve opens the cooling circuit.

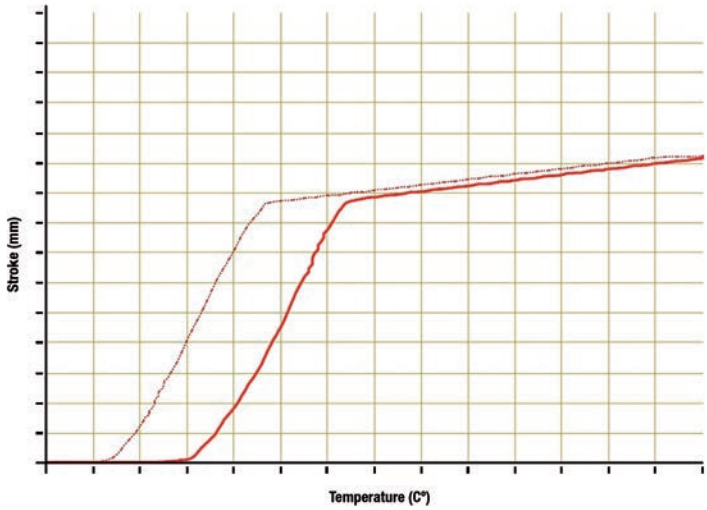
TECHNICAL INFORMATION

TYPES AND CHARACTERISTICS OF FAE THERMOSTATS

WAX Thermostats. These are based on the characteristics of special waxes with a high dilation coefficient. This type of thermostat possesses a rubber diaphragm surrounded with wax and an elongated rod. The wax is closed in a metallic capsule in contact with the cooling liquid. When the wax is cold, the valve is closed and blocks the way of the cooling liquid to the radiator. When the wax warms up it expands, expelling the rod and due to the action-reaction phenomenon, the valve opens. The closing takes place by means of a spring after the wax cools down. This kind of thermostat is the most widely used type of thermostats at present and is mounted originally in all internal combustion engines.



Displacement of the lid in function of the temperature of the FAE THERMOSTAT



CAUSES OF AN EXCESSIVE ENGINE HEATING

Although the cooling circuit is calculated in such a way that it maintains the engine at ideal temperature, sometimes the temperature of the engine increases in excess due to different reasons, some of them are:

a) Lack of circulation of cooling liquid due to poor condition of the pump blades.
b) Incorrect tuning of the ignition, thus increasing of the temperature in the cylinder.
c) Loose fan belt, which causes it to slip and thus the pump does not impulse the liquid with the necessary pressure.
d) Dirty radiator. The radiator is one of the elements that most influence the correct working of the cooling. If the leads are dirty, the liquid does not flow with the appropriate cadence and does not discharge the necessary calories to cool down. In this case the replacement of the radiator is needed.
e) In case of engines equipped with an electro fan, when changing the thermostat for one whit lower operating temperature, the THERMOCONTACT OR FAN OF VISCOUS CONNECTION must also be replaced since it is necessary to connect the fan to a lower temperature. In case this is not done, the thermostat opens completely his valve but the radiator does not cool since the fan does not push the air across the panel at the suitable temperature.

For all above reasons it can be appreciated that the thermostat is not always responsible of the overheating of the engine. If for whatever reason the cooling circuit of an engine is opened, the cooling liquid goes out. When filled again, it is necessary to bear in mind that the circuit is obstructed by the thermostat, which while being cold, is closed and the filling is not the appropriate as air chambers are remained in the interior.

INSTRUCTIONS FOR A CORRECT FILL UP

1) Fill the radiator slowly.
2) Once full turn the engine on WITHOUT ACCELERATING.
3) From this moment on the pump starts circulating the liquid through the whole circuit and filling the empty areas. At the same time it is heating up and the thermostat opens its passage; as a result the level in the radiator decreases. This is the appropriate moment to add more liquid and let the radiator “bubble” (a sign that air is expelling).
4) Next, the expansion deposit has to be filled up until reaching the ideal level (some engines have a dipstick).
If these steps are not followed, the engine will suffer large temperature oscillations given that temperature will increase greatly and will cause an excess of pressure, which will turn into a violent air expulsion giving the impression that the circuit enters into a boiling point.
Once the air eliminated, its space is filled and lowers the level of liquid in the radiator which remains very low, being this another cause of excessive warming of the engine.

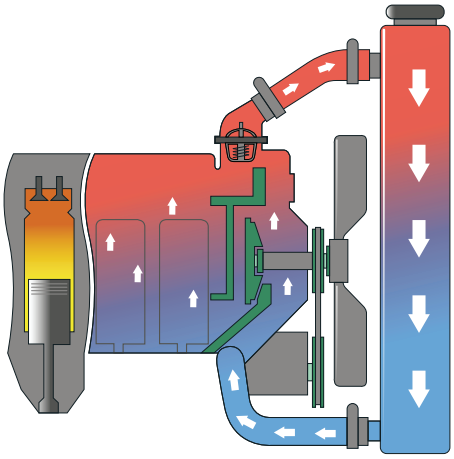
All the above produces excesses of temperature, which in some, cases can even destroy the thermostat.

On the DASHBOARD there are indicators which warn the driver of excess of temperature by a thermometer or a warning light (in some vehicles both simultaneously) before coming to all these possible damages.

INFORMACIÓN TÉCNICA

LA REFRIGERACIÓN EN LOS MOTORES DE COMBUSTIÓN INTERNA

Menos de una cuarta parte de la energía calorífica consumida en el motor de combustión interna se transforma en fuerza útil. El resto del calor, debe dispersarse de modo que ninguna parte llegue a calentarse hasta el punto de impedir su buen funcionamiento.



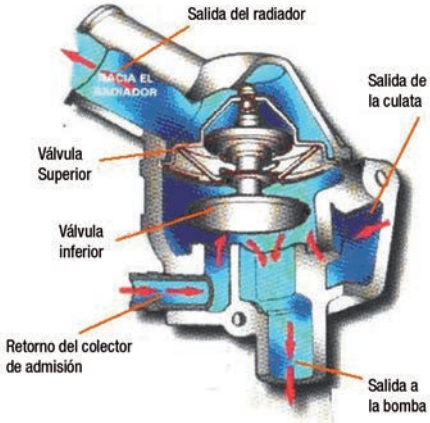
Con el acelerador pisado a fondo, alrededor del 36% del calor se pierde por fricción interna y por calentamiento del aceite de lubricación, y otro 33% se disipa por el sistema de refrigeración.

Existen dos tipos de refrigeración: directa e indirecta. En el sistema de refrigeración directa circula el aire entre las aletas externas previstas en los cilindros y en la culata.

En el sistema indirecto circula un refrigerante, que acostumbra a ser también anticongelante, por unos conductos dispuestos en el interior del motor y que se enfría en el radiador.

El circuito de refrigeración de motores de combustión interna, consta actualmente de:

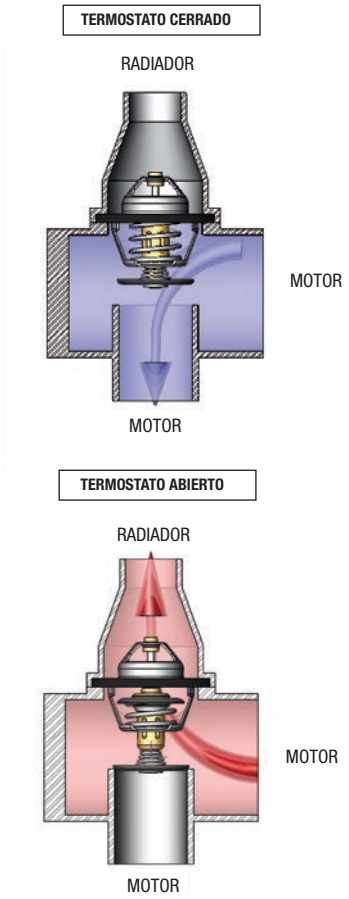
Una envoltura que rodea las partes calientes del motor. Un radiador donde se refrigera por aire, el líquido refrigerante que llega caliente desde el motor. Un ventilador que impulsa el aire hacia el radiador. Una bomba que fuerza la circulación del líquido refrigerante a través del sistema de refrigeración y un termostato colocado a la salida del motor, que regula el paso de líquido refrigerante del motor al radiador.



FUNCIÓN DEL LÍQUIDO REFRIGERANTE EN LA REFRIGERACIÓN Y CALENTAMIETO DEL MOTOR

Las dimensiones del radiador y del ventilador están calculadas de manera que permitan la refrigeración del motor bajo carga en las condiciones ambientales más rigurosas. Por este motivo, en los meses invernales y en los arranques en frío, la refrigeración del motor podría resultar excesiva, impidiéndole alcanzar la temperatura ideal de funcionamiento. De ahí deriva la necesidad de intervenir en el sistema de refrigeración, con el fin de que el tiempo necesario para que el motor alcance su temperatura de régimen, sea lo más breve posible y de que además exista la posibilidad, en las zonas de clima extremo, de mantener la temperatura del líquido refrigerante de refrigeración entre 70°C y 90°C, límites ideales para el buen funcionamiento del motor.

Para llegar a este resultado, basta disminuir convenientemente la eficacia del circuito de refrigeración, reduciendo la circulación del refrigerante o incluso suprimiéndola y haciéndolo circular únicamente por el interior del bloque motor
Quien ejerce esta función es el TERMOSTATO, una válvula que suele intercalarse en el conducto que va desde el motor al radiador.



Además de su función de válvula reguladora del caudal de líquido refrigerante, el termostato se emplea a veces para accionar la apertura o cierre de contactos eléctricos por encima de cierto límite de temperatura. Estos interruptores sirven normalmente para detectar, con una luz roja en el cuadro de instrumentos, una temperatura peligrosa o para poner en funcionamiento un ventilador. A éstos se les llama TERMOCONTACTOS.

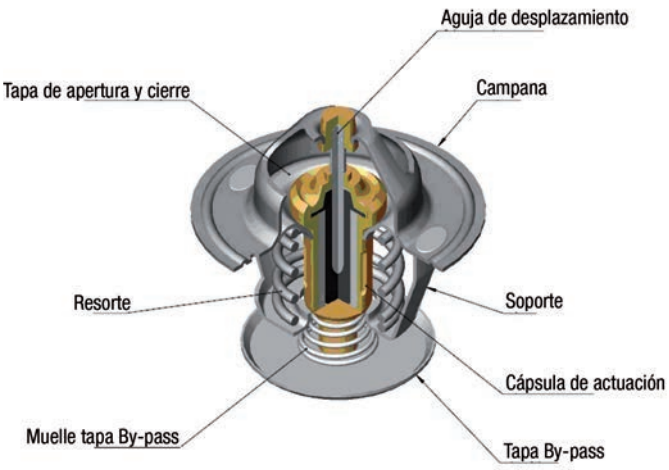
Todos los termostatos que actúan intercalados en el circuito del líquido refrigerante, deben estar previstos de un pequeño paso, para las burbujas de aire, que permanezca abierto incluso con el motor frío cuando la válvula del termostato se encuentre cerrada para evitar la formación de bolsas de aire en contacto con el elemento sensible del termostato, pues tarda mucho más tiempo en transmitir el calor el aire que el líquido refrigerante, y cuando el motor estuviese demasiado caliente, el termostato no abriría el paso al radiador en el momento preciso.

Además, para no detener la circulación del líquido refrigerante debida a la bomba, es preciso que la cámara donde está situado el termostato esté en comunicación, a través de un BYPASS (segundo paso), con la bomba del líquido refrigerante. Dicho bypass, con el motor frío, está abierto y se cierra con el motor caliente cuando la válvula termostática abre el circuito de refrigeración.

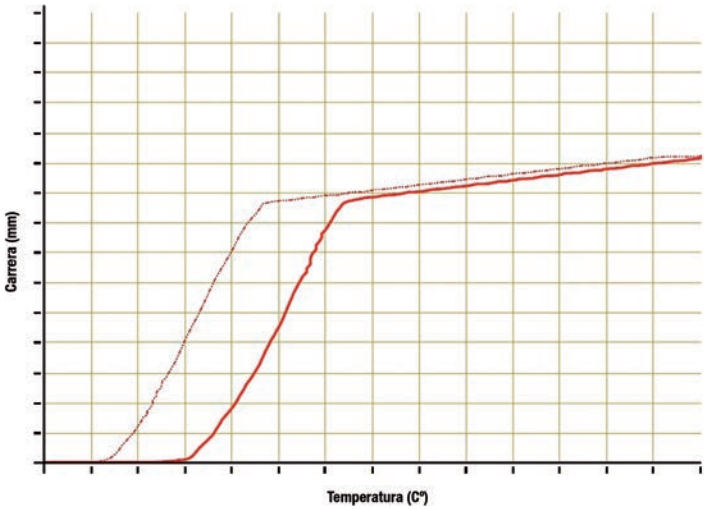
INFORMACIÓN TÉCNICA

TIPOS Y CARACTERÍSTICAS DEL TERMOSTATO FAE

Termostato de CERA. Se basan en la propiedad de ceras especiales que poseen un alto coeficiente de dilatación. Este tipo de termostato posee un diafragma de goma rodeado de cera y una varilla alargada. La cera está encerrada en una cápsula metálica en contacto con el líquido refrigerante. Cuando la cera está fría, la válvula está cerrada e impide el paso del líquido refrigerante al radiador. Al calentarse la cera se dilata, expulsando la varilla y por el fenómeno de acción reacción, abre la válvula. El cierre se produce mediante un muelle al enfriarse la cera.
Este es el tipo de termostato más difundido en la actualidad y el que se monta en origen en todos los motores de combustión interna.



Desplazamiento de la tapa en función de la temperatura del TERMOSTATO FAE



CAUSAS DE UN CALENTAMIENTO EXCESIVO DEL MOTOR

Aunque el circuito de refrigeración está calculado para que mantenga el motor a la temperatura ideal, algunas veces la temperatura del motor aumenta en exceso debido a diversas causas.

Vamos a enumerar algunas de ellas:

a) Falta de circulación del líquido refrigerante debido al mal estado de las aletas de la bomba.
b) Mala puesta a punto del encendido, aumentando por este motivo la temperatura en el cilindro.
c) Correa floja, con lo cual patina y la bomba no impulsa el líquido con la presión necesaria.
d) Radiador sucio. El radiador es uno de los elementos que más influye en el buen funcionamiento de la refrigeración. Si están sucios sus conductos, el líquido no pasa con la cadencia adecuada y no desprende las calorías necesarias para enfriarse. En este caso se hace necesaria su sustitución.
e) En el caso de motores equipados con electro ventilador, al cambiar el termostato por otro de temperatura de apertura más baja, debe de cambiarse también el TERMOCONTACTO O VENTILADOR DE ACOPLAMIENTO VISCOSO ya que asimismo se debe conectar el ventilador a una temperatura inferior, pues si no es así, el termostato abre totalmente su válvula pero el radiador no enfría pues el ventilador no empuja el aire a través del panel a la temperatura adecuada.

Como se puede observar por todos estos motivos, no siempre tiene la culpa el termostato del excesivo aumento de la temperatura. Cuando por algún motivo se abre el circuito de refrigeración de un motor, sale el líquido refrigerante. Al llenarlo de nuevo, hay que tener en cuenta que el circuito está obstruido por el termostato, que al estar frío, está cerrado y el llenado no es el adecuado pues quedan cámaras de aire en su interior.

PARA LLENARLO ADECUADAMENTE SE DEBEN SEGUIR ESTOS PASOS:

1) Llenar el radiador lentamente.
2) Cuando está lleno se pone el motor en marcha SIN ACELERARLO.
3) A partir de este momento, la bomba hace circular el líquido enviándolo a todo el circuito y llenando las zonas vacías. Al mismo tiempo va cogiendo temperatura y el termostato abre su paso; a consecuencia el nivel en el radiador desciende y es el momento oportuno para ir añadiendo líquido, dejando que el radiador "burbujee" (síntoma de que se elimina el aire).
4) A continuación se llena el depósito de expansión hasta alcanzar el nivel óptimo (hay motores que llevan un sangrador).
Si no se hace el llenado por este método, el motor tendrá unas grandes oscilaciones de temperatura ya que aumentará exageradamente y provocará un exceso de presión, traduciéndose en una expulsión violenta del aire dando la impresión de que el circuito entra en ebullición.
Una vez eliminado el aire, el espacio que ocupa éste, se llena y desciende el nivel en el radiador quedando con poca cantidad de líquido, siendo ésta otra de las causas de excesivo calentamiento del motor.

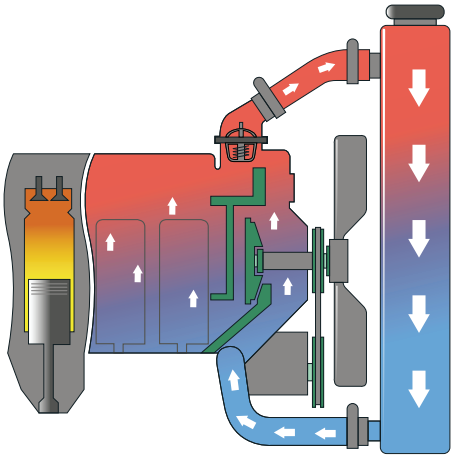
Todos estos hechos producen excesos de temperatura, que en algunos casos pueden llegar a destruir el termostato.

Existe en el TABLERO DE INSTRUMENTOS un indicador de exceso de temperatura que avisa al conductor de la anomalía por medio de un termómetro o de una luz de advertencia (en algunos vehículos los dos métodos a la vez) antes de llegar a todos estos desperfectos.

INFORMATION TECHNIQUE

LA RÉFRIGÉRATION DANS LES MOTEURS DE COMBUSTION INTERNE

Moins d'une quatrième partie de l'énergie calorifique consommée dans le moteur de combustion interne se transforme en force utile. Le reste de chaleur, doit se dissiper de manière qu'aucune partie du moteur n'arrive à se chauffer jusqu'au point d'empêcher son bon fonctionnement.



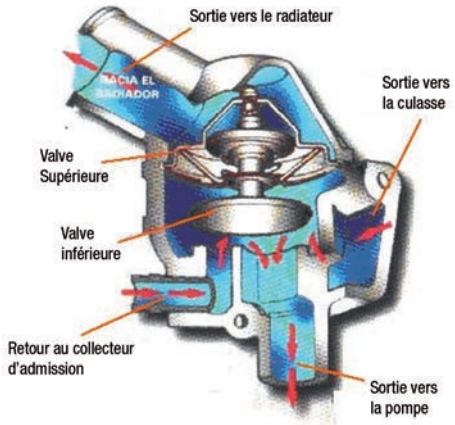
Avec l'accélérateur foulé à fond, autour de 36% de la chaleur se perd par une friction interne et par un chauffage de l'huile de lubrification, et l'autre 33% se dissipent par le système de réfrigération.

Deux types de réfrigération existent: direct et indirect. Dans le système de réfrigération direct l'air circule entre les nageoires externes prévues dans les cylindres et dans la culasse.

Dans le système de réfrigération indirect circule un réfrigérant, qui habituellement est aussi antigel, dans quelques conduits disposés à l'intérieur du moteur et que l'on refroidit dans le radiateur.

Le circuit de réfrigération de moteurs de combustion interne, est établi actuellement de:

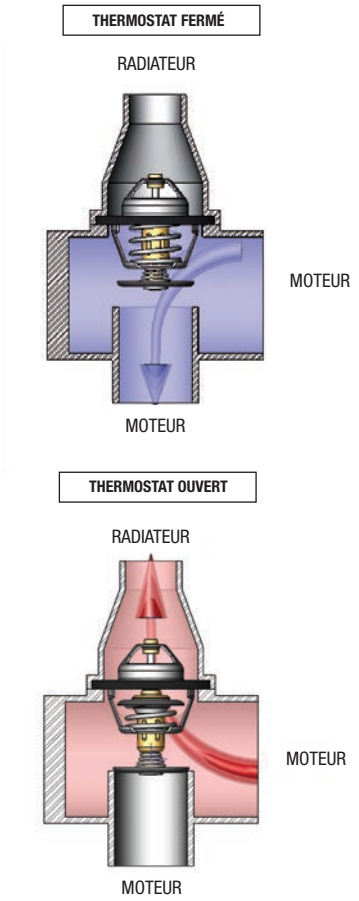
Une enveloppe qui entoure les parties chaudes du moteur. Un radiateur où l'air est réfrigéré, un liquide réfrigérant qui arrive chaud au moteur. Un ventilateur qui pousse l'air vers le radiateur. Une pompe qui force la circulation du liquide réfrigérant à travers le système de réfrigération et un thermostat placé à la sortie du moteur qui règle le liquide réfrigérant du moteur au radiateur.



LA FONCTION DE LIQUIDE RÉFRIGÉRANT DANS LA RÉFRIGÉRATION ET DANS LE CHAUFFAGE DU MOTEUR

Les dimensions du radiateur et du ventilateur sont calculées de manière qu'ils permettent la réfrigération du moteur en charge dans les conditions ambiantes les plus rigoureuses. Pour ce motif, dans les mois hivernaux et au départ du froid, la réfrigération du moteur pourrait sembler excessive, en lui empêchant d'atteindre la température idéale de fonctionnement. De là, il dérive la nécessité d'intervenir au système de réfrigération, pour laquelle le temps nécessaire pour que le moteur atteigne sa température de régime soit le plus bref possible. De plus, il y a possibilité, dans les zones de climat extrême, de maintenir la température de liquide réfrigérant de réfrigération entre 70°C et 90°C, limites idéales pour le bon fonctionnement du moteur.

Pour arriver à ce résultat, il suffit de diminuer convenablement l'efficacité du circuit de réfrigération, en réduisant la circulation du réfrigérant ou même en la supprimant et en le faisant circuler uniquement dans l'intérieur du bloc moteur
Cette fonction est exercée par le THERMOSTAT, une valve qui d'habitude est intercalée dans le conduit allant du moteur au radiateur.



En plus de sa fonction de valve régulatrice du débit de liquide réfrigérant, le thermostat s'emploie parfois pour actionner l'ouverture ou la fermeture des contacts électriques au-dessus d'une certaine limite de température. Ces interrupteurs servent normalement à détecter, par un voyant rouge dans le tableau de bord, une température dangereuse ou à mettre en fonctionnement un ventilateur. On les appelle THERMOCONTACTES.

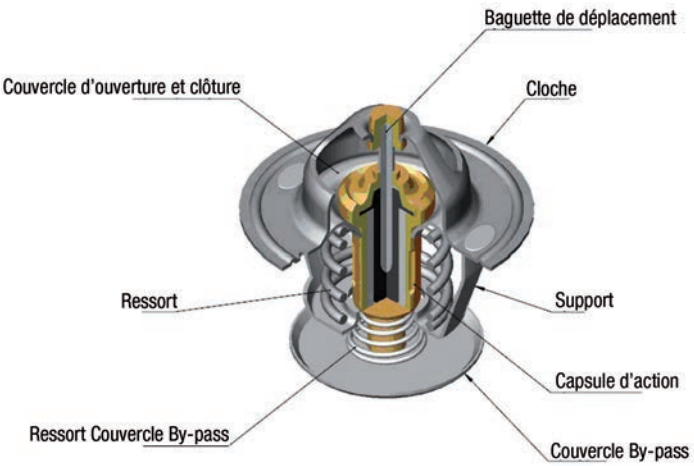
Tous les thermostats qui agissent intercalés dans le circuit de liquide réfrigérant, doivent être prévus d'un petit pas pour les bulles d'air, qui reste ouvert même avec le moteur froid quand la valve du thermostat se trouvera fermée pour éviter la formation de bourses d'air en contact avec l'élément sensible du thermostat, car cela met plus de temps de transmettre l'air et la chaleur que le liquide réfrigérant et quand le moteur sera trop chaud, le thermostat n'ouvrira pas le pas au radiateur à ce moment précis.

De plus, pour ne pas arrêter la circulation de liquide réfrigérant due à la pompe, il faut que la chambre où le thermostat soit en communication, au travers d'un BYPASS (deuxième pas) avec la pompe de liquide réfrigérant. Ce bypass, avec le moteur froid, s'ouvre et se ferme avec le moteur chaud quand la valve thermostatique ouvre le circuit de réfrigération.

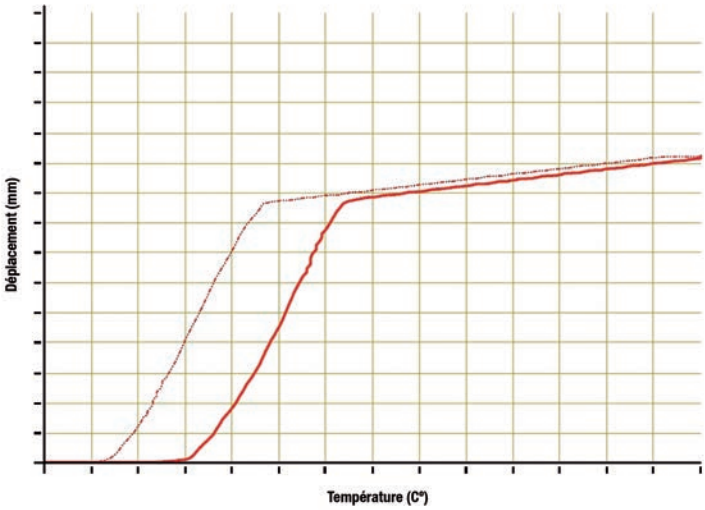
INFORMATION TECHNIQUE

TYPES ET CARACTÉRISTIQUES DU THERMOSTAT FAE

Thermostat en CIRE. Ils sont basés sur la propriété de cire spéciale qui possède un haut coefficient de dilatation. Ce type de thermostat possède un diaphragme de caoutchouc entouré d'une cire et d'une baguette allongée. La cire est enfermée dans une capsule métallique en contact avec liquide réfrigérant. Quand la cire est froide, la valve est fermée et empêche le passage de liquide réfrigérant au radiateur. Quand la cire est chauffée il se dilate, en expulsant la baguette et par le phénomène d'action-réaction, ouvre la valve. La fermeture se produit grâce à un ressort quand la cire s'est refroidie. C'est le type de thermostat le plus diffusé actuellement et celui qui est monté original dans tous les moteurs de combustion interne.



Déplacement du couvercle en fonction de la température du THERMOSTAT FAE



CAUSES D'UN CHAUFFAGE EXCESSIF DU MOTEUR

Bien que le circuit de réfrigération soit calculé pour qu'il maintienne le moteur à la température idéale, parfois il se peut que la température du moteur augmente en excès dû à des causes diverses.

Nous allons énumérer certaines d'entre elles:

a) Un manque de circulation du liquide réfrigérant dû au mauvais état des nageoires de la pompe.
b) Une mauvaise mise au point de l'allumage, en augmentant pour ce motif la température du cylindre.
c) Une courroie lâche, par conséquent elle patine et la pompe ne pousse pas le liquide avec la pression nécessaire.
d) Un radiateur sale. Le radiateur est l'un des éléments qui influe le plus sur le bon fonctionnement de la réfrigération. Si ses conduits sont sales, le liquide ne passe pas avec la cadence appropriée et ne détache pas les calories nécessaires pour se refroidir. Dans ce cas son replacement devient nécessaire.
e) Dans le cas des moteurs équipés avec un électro ventilateur, après avoir changé le thermostat pour un autre d'une température de plus basse ouverture, il faut changer aussi le THERMOCONTACTE ou LE VENTILATEUR D'ACCOUPLEMENT VISQUEUX puisque de la même manière il faut connecter le ventilateur à une température inférieure, si ce n'est pas le cas, le thermostat ouvre totalement sa valve mais le radiateur ne refroidit pas puisque le ventilateur ne pousse pas l'air à travers du panneau à la température correcte.

Comme on peut observer pour tous ces motifs, le thermostat n'est pas toujours coupable, de l'augmentation excessive de la température. Quand pour un certain motif le circuit de réfrigération d'un moteur s'ouvre, le liquide réfrigérant sort. Après l'avoir rempli de nouveau, il faut tenir en compte que le circuit est obstrué par le thermostat, qui en étant froid, est fermé et le remplissage n'est pas adéquat puisque ils restent des chambres à air dans son intérieur.

INSTRUCTIONS POUR UN REMPLISSAGE CORRECT:

1) Remplir lentement le radiateur.
2) Quand le radiateur est plein on met le moteur en marche SANS L'ACCÉLÉRER.
3) À partir de ce moment, la pompe fait circuler le liquide en l'envoyant à tout le circuit et en remplissant les zones vides. En même temps il se réchauffe et le thermostat ouvre son pas; par conséquence le niveau dans le radiateur descend et c'est le moment idéal pour ajouter du liquide, en permettant que le radiateur "pétille" (le symptôme dont l'air est éliminé).
4) Ensuite le dépôt d'expansion se remplit jusqu'à atteindre le niveau parfait (il y a des moteurs qui portent un système pour vider).
Si le remplissage n'est pas fait de cette manière, le moteur aura quelques grandes oscillations de température puisqu'il augmentera exagérément et provoquera un excès de pression, en se traduisant dans une expulsion violente de l'air donnant l'impression que le circuit entre dans un état d'ébullition.
Quand l'air a été éliminé, l'espace que celui-ci occupait, est remplit et le niveau du liquide dans le radiateur descend en restant avec peu de quantité. C'est une des autres causes d'un chauffage excessif du moteur.

Tous ces faits produisent un excès de température, qui dans quelques cas peuvent arriver à détruire le thermostat.

Dans le TABLEAU DE BORD, il existe un indicateur d'excès de température qui prévient le conducteur de l'anomalie au moyen d'un thermomètre ou une lumière d'avertissement (dans quelques véhicules les deux méthodes en même temps) avant d'arriver à tous ces défauts.

Water flange.
Tapas de termostato.
Boitier de sortie d'eau.

Vehicles models for general information only. Not to be used as a detailed applications guide.
Refer to Vehicle Applications to trace the Water flange of a specific model.
The parts shown in this Catalogue, are subject to modification in design or material without notice.
Manufacturer's names and original numbers are only quoted for ease of search and reference purposes.

Los modelos de vehículos se dan como información general. No se deben utilizar como guía detallada de aplicaciones.
Para identificar una Tapa de termostato de un modelo específico, consultar Aplicaciones por Vehículos.
Las piezas contenidas en este Catálogo, pueden estar sujetas a modificaciones dimensionales o de material, sin previo aviso.
Los nombres y referencias de los fabricantes sirven únicamente para ayudar a encontrar más rápidamente nuestros productos.

Les modèles de vehicles sont présentés à titre d'information générale uniquement. Le document ne constitue pas un guide pratique et ne doit pas être utilisé comme tel.
Pour trouver un modele spécifique d'un Boitier de sortie d'eau consulter les Applications par Vehicules.
Les pièces contenues dans ce Catalogue, peuvent être modifiées en matériel ou exécution sans préavis.
Ainsi les noms et références des fabricants sont mentionnés dans l'unique but de faciliter la recherche de nos produits.

For further applications see our interactive catalog in *www.fae.es*
Para más aplicaciones consulte nuestro catálogo interactivo en *www.fae.es*

Vehicles models for general information only. Not to be used as a detailed applications guide.
Refer to Vehicle Applications to trace the Control valve (Heating) of a specific model.
The parts shown in this Catalogue, are subject to modification in design or material without notice.
Manufacturer's names and original numbers are only quoted for ease of search and reference purposes.

Los modelos de vehículos se dan como información general. No se deben utilizar como guía detallada de aplicaciones.
Para identificar una Electroválvula termostática (Calefacción) de un modelo específico, consultar Aplicaciones por Vehículos.
Las piezas contenidas en este Catálogo, pueden estar sujetas a modificaciones dimensionales o de material, sin previo aviso.
Los nombres y referencias de los fabricantes sirven únicamente para ayudar a encontrar más rápidamente nuestros productos.

Les modèles de vehicles sont présentés à titre d'information générale uniquement. Le document ne constitue pas un guide pratique et ne doit pas être utilisé comme tel.
Pour trouver un modele spécifique d'un Valve magnétique (Chauffage) consulter les Applications par Vehicules.
Les pièces contenues dans ce Catalogue, peuvent être modifiées en matériel ou exécution sans préavis.
Ainsi les noms et références des fabricants sont mentionnés dans l'unique but de faciliter la recherche de nos produits.

For further applications see our interactive catalog in *www.fae.es*
Para más aplicaciones consulte nuestro catálogo interactivo en *www.fae.es*
Pour déterminer les autres applications veuillez notre catalogue interactive à *wwww.fae.es*

INFORMATION / INFORMACIÓN / INFORMATION

G.B.

This Catalog considers vehicles with:

- Left Hand Drive (L.H.D.)
- Manual Gear, 5 speed
- Without Air Conditioning
- Without Check Control
- Without Cruise Control
- Without ABS

As the Standard vehicle (generic).

Vehicles with different features (criteria) are treated in a specific way in the information column.

E

En este Catálogo se han considerado los vehículos con:

- Conducción a la izquierda (L.H.D.)
- Cambio Manual, 5 velocidades
- Sin Aire Acondicionado
- Sin Check Control
- Sin Cruise Control
- Sin ABS

Como el vehículo Standard (genérico).

El resto de vehículos con otras características (criterios) se tratan de forma específica en la columna de información.

F

Dans ce Catalogue sont considérés les véhicules avec:

- Conduction à gauche (L.H.D.)
- Avec boîte de vitesses manuelle, 5 vitesses
- Sans Air Conditionné/Climatisation
- Sans Tableau de Contrôle
- Sans Vitesse de Croisière
- Sans Antiblocage (ABS)

Comme le véhicule Standard (générique).

Le reste des véhicules avec d'autres caractéristiques (critères) sont abordés d'une façon spécifique dans la colonne d'information.
